

# Run apps on your Domain

**NOTE** - This section explains how you can brand each of the applications your 100% build using Mobsted Constructor to any subdomain of you website. If you need to brand a Converted Web site to app - [use this article](#).

You can also watch a short video on how this is done

**NOTE** - in SaaS you can only place an app to any subdomain of a full domain name, not to the domain itself. If you need to have a web application built on Mobsted to run from your main domain - please contact us.

As example, your app can work from myapp.mydoamain.com for all your users, instead of from a mobsted.com domain.

1. Open app's Settings marked **red** , open tab called Access Info marked **green** .

The screenshot shows the Mobsted Constructor interface. At the top, there is a blue navigation bar with several tabs: GENERAL, INTEGRATIONS, APP SETUP, and APP DATA. The 'APP SETUP' tab is selected and highlighted with a red box. Below the navigation bar, there are three sub-tabs: SETTINGS, ACCESS INFO, and EXTERNAL ANALYTICS. The 'ACCESS INFO' sub-tab is selected and highlighted with a green box. The main content area displays the 'ACCESS INFO' settings for an application named 'Just Be Kind'. The settings include: Application name (Just Be Kind), Description (Just Be Kind), Icon title (Just Be Kind), Icon image (a placeholder image showing four app icons: Health, Passbook, Settings, and Just Be Kind), Choose display mode (standalone (Preferred- just like any other native app)), Splash screen background color (#ffffff), and Color of the browser panels (when available) (#072138). A green 'SAVE' button is located at the bottom right of the form.

2. You will see the following section:

SETTINGS
ACCESS INFO
EXTERNAL ANALYTICS

Please fill up how you want users to see your app in URL:

any subdomain name  
login

your full domain name  
justbekindapp.com

Please log into your domain management system and create two CNAMEs. They should look EXACTLY like the table below:

Type	Name	Data
CNAME	login	viafdn.mobsted.com
CNAME	login-admin	viafdn-admin.mobsted.com

I'm done

- Enter any name for your subdomain marked **red** , like - "login", "myapp", "customers", "users", "shop", or anything you want users to see.
- Enter you full web domain name marked **green** , including the domain zone, like .com .org .net and so on

3. Now you need to go to your domain management tool, and **create 2 CNAME records to EXACTLY match** the table marked **blue** .

our domain management tools will all have different interfaces, but as an example, this is how adding two CNAMEs would look in the CloudFlare management console:

login.itpcac.com is an alias of viafdn.mobsted.com and has its traffic proxied through Cloudflare.

Type

Name (required)

Target (required)

Proxy status

TTL

CNA...

login

viafdn.mobsted.com

☒
☐
Proxied

Auto

Use @ for root

login-admin.itpcac.com is an alias of viafdn-admin.mobsted.com and has its traffic proxied through Cloudflare.

Type

Name (required)

Target (required)

Proxy status

TTL

CNA...

login-admin

viafdn-admin.mobsted.com

☒
☐
Proxied

Auto

Use @ for root

4. Press green **I'm done** button, after you have created both CNAMEs .

Wait for up to 1 minute

**IF ALL WORKED WELL** - you will see a **Connection Success** message and your URL will be live, so you can open it in browser.
